Handover Checklist — Shrikant → You

Handover date: Monday May 19, 2025 | Complete all items before starting the build plan

1. The Codebase

Everything starts here. Without this, nothing else matters.

Item	What to ask / check	Received?
GitHub / repo access	Ask Shrikant to push all code to a GitHub repo before Monday if it's still local. Get added as a collaborator. Don't accept a folder or zip transfer — you need version history.	☐ Yes / No
Repo URL	Note it here once shared.	☐ Yes / No
Can you clone + run it?	Clone fresh on your machine during the handover call. Follow his setup steps. This surfaces 'works on my machine' issues immediately.	☐ Yes / No

2. CLAUDE.md — The Most Important File

This is the context file Claude Code reads at the start of every session. It's the project's brain.

Item	What to ask / check	Received?
CLAUDE.md exists?	Ask directly: 'Does the project have a CLAUDE.md in the root folder?' If yes, it must be in the repo. If no, ask him to write one before Monday.	☐ Yes / No
What it should contain	What the app does, the tech stack, data model, decisions made, anything Claude Code should know before touching the code.	☐ Yes / No
If it doesn't exist	Ask Shrikant to write a rough one before Monday. His version — however rough — is better than you reconstructing it from scratch.	☐ Yes / No

3. Credentials & Configuration

The app won't run without these. Get them over a secure channel — not in the repo.

Item	What to ask / check	Received?
.env.example file	All environment variable names listed (not the actual values). Tells you what keys the app needs to function.	☐ Yes / No
Actual .env values	Get separately over Slack DM or 1Password. Never committed to the repo.	☐ Yes / No
Clari MCP config	API keys, server URL, how it's connected. This is the only working integration — without this the core loop doesn't run.	☐ Yes / No
Salesforce credentials	Even if sync isn't built yet, know what access exists for when you build it.	☐ Yes / No
Segment keys	Write key and any read tokens if used.	☐ Yes / No

4. How to Run It

Get to a running app on your machine before the call ends.

Item	What to ask / check	Received?
Tech stack	Frontend framework, backend language, database. You need to know what you're working with.	☐ Yes / No
Local setup steps	Step-by-step README or verbal walkthrough. Every dependency, every command.	☐ Yes / No
How it's deployed	Where does it live? Vercel, Railway, a server? How do you push a new version?	☐ Yes / No
Anything local-only?	Parts that only work on his machine — specific paths, local files, hardcoded values. Surface these now.	☐ Yes / No

5. The Clari MCP — Understand It Deeply

This is the only live integration. Understand every part of it before the call ends.

Item	What to ask / check	Received?
Where does it live?	Separate repo, a folder inside the project, or hosted somewhere?	☐ Yes / No
How is it triggered?	Manual, scheduled, or event-based? Who runs it today — just Shrikant?	☐ Yes / No
What does it return?	Ask him to show you the full data structure: what fields come back when a task is created.	☐ Yes / No
Does it work for ROW accounts?	It was built for US accounts. Has it been tested on non-US? This matters for Week 1.	☐ Yes / No
Run it live on the call	Take a real call recording, trigger the MCP, watch a task appear. If this doesn't work on the call, the handover isn't done.	☐ Yes / No

6. The Account Data

Currently a one-time CSV upload. Know exactly how it works before you replace it.

Item	What to ask / check	Received?
Where is the CSV?	Which folder, what's the filename. Is it committed to the repo or sitting on his desktop?	☐ Yes / No
How is it loaded?	Is there a script, an import step, or was it manual? Can you repeat it?	☐ Yes / No
CSM-to-account mapping	Is it a column in the CSV or a separate file? How does the app know which accounts belong to which CSM?	☐ Yes / No
Is it current?	When was it last updated? Are all regions in there or just US?	☐ Yes / No

7. What Shrikant Knows That Isn't Written Down

Ask these questions explicitly. The answers are the most valuable part of the handover.

Item	What to ask / check	Received?
What's broken or fragile?	Things he knows don't work properly or will break under certain conditions.	☐ Yes / No
What did you decide not to build and why?	So you don't re-debate closed decisions.	☐ Yes / No
What parts are you least confident about?	The honest signal of where the real risk is.	☐ Yes / No
What would you do differently if starting again?	The most important question. His answer shapes your Week 1.	☐ Yes / No
If you were continuing next week, what would you do first?	Ask this last. His answer tells you more about the real state of the codebase than any doc.	☐ Yes / No

The Handover is Complete When

- ☐ You can clone the repo fresh on your machine and it runs
- ☐ CLAUDE.md exists and is in the repo
- ☐ You have all credentials in a secure location
- ☐ You triggered the Clari MCP live and saw a task created
- ☐ You asked all 5 questions in Section 7 and wrote down the answers
- ☐ You know what Shrikant would do first if he were continuing the build

i If any of these aren't done by end of the Monday call, schedule a follow-up before starting Week 1 of the build plan.
